1. General Introduction

The Hotel Room Booking is a software application designed the process of reserving hotel rooms. It allows customers to view real-time room availability, make reservations, manage bookings, and process cancellations. For hotel administrators. It provides tools to manage room inventory, pricing, and customer check-ins and check-outs. The system aims to replace manual, error-prone booking methods (e . g . Phone calls, paper logs) with a centralized, efficient digital platform.

2. Problem Statement

Many small to mid-sized hotels still rely on manual or semi-digital system (e . g . Spreadsheets, walk-in only or pen, or pen-paper records,) leading to several issues:

- Double booking : the same room allocated to multiple guests.
- Lack of real-time availability : Customer cannot check room status online.
- Inefficient cancellation handing : No automated refund or calendar update.
- No centralized record: Guest histories, payment status, and preferences are scattered.
- Poor customer experience : Long wait times, no booking confirmation, no room comparison.

these problem result in revenue loss, customer dissatisfaction, and increased administrative workload.

3. Project Vision

To develop a reliable, user-friendly, and scalable Hotel Room Booking System That:

. Provides real-time room availability and instant booking confirmation.

. Reduces manual errors by automating reservations, cancellation, and payment tracking.

. Offers an admin dashboard for room/price management and booking oversight.

. Enhances customer experience with search filters (price, room type, amenities) and digital payment integration.

. Ultimately improves occupancy rate and operational efficiency for hotel staff.

4. Project scopes

The project scope is divided into functional and technical components:

Functional scope (Included).

. User Module : Registration, login, profile management (Guest).

. Room Management : Add/edit/delete room types (AC/non-AC, deluxe /suite), pricing, photos, amenities.

. Booking Module: Search room by date /guests select room, make payment, generate booking ID.

. Admin panel : View all bookings, check – in / check- out guests, generate revenue reports.

. Payment Integration : Credit cart, PayPal, or cash on arrival (basic mode).

Out of Scope (Not Included)

. Integration with third- party

. Advanced CRM or Loyalty points system.

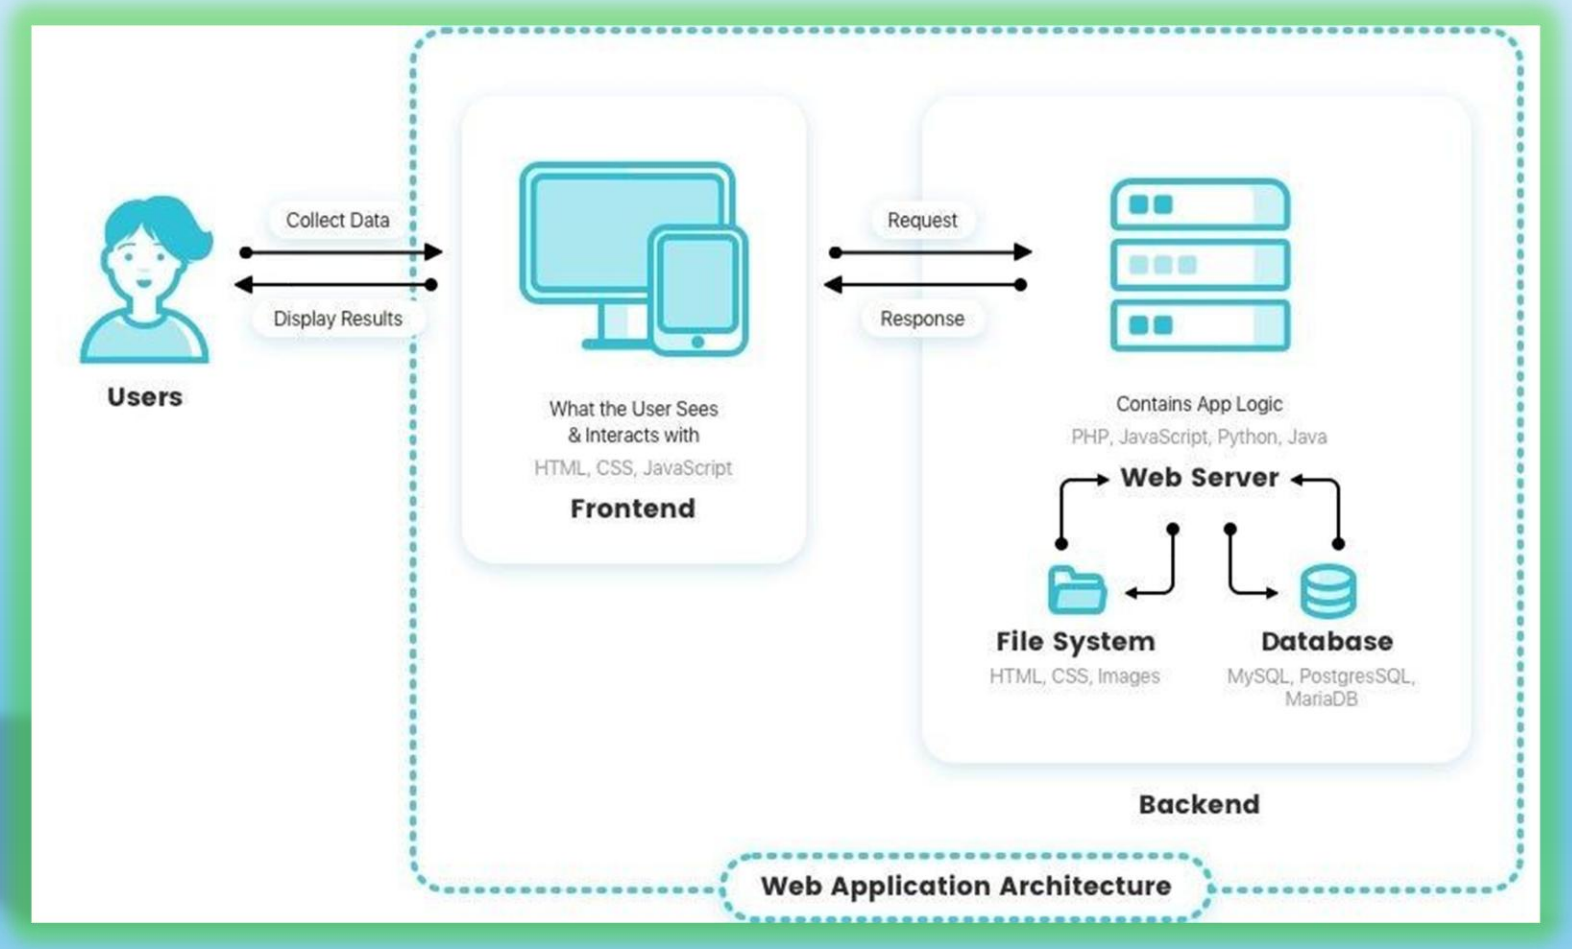
. Multi-hotel chain support

. Housekeeping staff mobile app. . Real-time chat or voice assistant.

Technical Scope (Optional to mention)

. Platform: web-based or mobile app

. Frontend Technology :. Next .Js



Thank You.
